
Anchors (m = 1): missed synapses, false splits and false merges 0.8% of a neuron's synapses; spurious synapses 5% added; transmitter sign flips 6% of neurons. Linear: rectified model, R0, 107 targets; sign flips unrectified, 133 targets. LIF: 9 seed-specific case-study perturbations, R0; sign flips seed-exempt. Break-even = median drift equals the median left–right disagreement.
